CS-104 Quiz 2

Fall 2026

Name: _____

This is an in-class, closed-book quiz. If you have any questions, please feel free to ask them. When you are finished, you can turn it in and go.

1. (2 points)

Give the value of each Python expression below. If it raises an error instead, name the error.

```
>>> not False
```

True — example answer

```
>>> True and False
```

```
>>> 4 <= 4 and 2 > 5
```

```
>>> 10 != 10
```

```
>>> 3 < 5 or 1 > 100
```

2. (3 points)

Write a code segment that inputs a temperature in Fahrenheit from the user (as a float) and prints one of the following, based on the value:

- `"freezing"` if the temperature is at or below 32
- `"cold"` if the temperature is above 32 and below 60
- `"mild"` if the temperature is between 60 and 80 (inclusive)
- `"hot"` if the temperature is above 80

Just write a code segment; you don't need to include documentation, an algorithm, or test cases.

3. (2 points)

Fill in the blanks in the `range(...)` call below so this code prints every multiple of 5 from 5 to 50, inclusive:

```
for n in range(___, ___, ___):
    print(n)
```

4. (2 points)

Consider the following (syntactically correct) code segment:

```
total = 0
for i in range(1, 11):
    total = total + i
print(total)
```

Write a `while` loop that does the same thing.

5. (1 point)

The following code is supposed to print the numbers 1 through 5, but it has a bug. Identify the bug and explain how to fix it.

```
i = 1
while i < 5:
    print(i)
    i = i + 1
```
