CS-104 Retrieval Quiz

Fall 2026 · Week 1, Friday

Name: _____

1.

Which of these is a valid Python variable name?

a) `3data`
b) `my data`
c) `my_data`
d) `True`

2.

Consider this code:

```
x = input("Age: ")
print(x + 1)
```

The user types `20`. What happens?

a) It prints `21`
b) It prints `201`
c) It raises a `TypeError`, because `input()` returns a string
d) It raises a `NameError`, because `x` is not defined

3.

Consider this code:

```
hot = 273 + 100
print(Hot - 100)
```

What happens?

a) It prints `273`
b) It raises a `NameError`, because Python is case-sensitive and `Hot` was never assigned
c) It prints `373`
d) It raises a `SyntaxError`, because variable names can't start with a capital letter

4.

Variable names and objects are different things: an **object** is a piece of data (like `123` or `"hi"`), and a **variable** is a name that refers to an object. For each item below, write whether it is an **object** or a **variable name**. If it is an object, also write its type: `int`, `float`, or `str`.

`12`
object, int — example answer

`"bye"`

`bye`

`75`

`count_2`

`2.5`

`"2.5"`

`total`

`'x'`

`-4`

`"7"`
