2.12 Turtle Stick Figure (Lab 2.2)

LAB ACTIVITY | 2.12.1: Turtle Stick Figure (Lab 2.2) | Full screen | 0 / 40

Start with this turtle-based template code and rename it `stick_figure.py`.

- template-turtle.py

Use turtle graphics to draw a scalable stick figure as shown here.

Here are some requirements:

- Begin by creating a constant in your program called `UNIT` and have it refer to a value of 50. Do not use an `input` command; just hard-code the value. In the picture, the distance between tick marks is a `UNIT` length.
- When the code is complete, you should be able to get a differently-sized but properly-proportioned stick figure by changing the value of `UNIT` and rerunning the program. Be sure to check that this is the case before your submit.
- The length of the legs should match those in the drawing above. To determine this length, you can use the Pythagorean theorem.
- It's perfectly fine if you end up with the turtle in a different position than shown in the reference figure.

For this exercise, you'll need to use a couple new Turtle drawing commands:

- `circle(radius)` — This command draws a circle from where the turtle is currently sitting of a given radius.
- `penup()` and `pendown()` — These two commands raise and lower the pen respectively, which allows you to raise the pen, move somewhere you'd like to go without drawing a line, and then drop the pen start drawing again.

Find the details on these and other commands documented in Python's Turtle graphics reference documentation .
