CS-104 Retrieval Quiz (ANSWER KEY)

Fall 2026 · Week 4, Friday

Name: _____

Closed book, no devices. For questions 1–3, circle the one best answer. For question 4, write your code in the space provided (no algorithm, documentation, or test cases needed).

1.

Suppose `x = 4` and `y = 9`. What is the value of `not x == 4 or y < 5`?

a) `True`

b) `False` **[correct]**

c) `None`

d) It raises an error

2.

What does this code print?

```
x = 95
if x >= 60:
    print("You've got a D")
elif x >= 70:
    print("You've got a C")
elif x >= 80:
    print("You've got a B")
elif x >= 90:
    print("You've got an A")
else:
    print("Keep studying!")
```

a) `You've got a D` **[correct]**

b) `You've got an A`

c) All four grade messages

d) `Keep studying!`

3.

What happens when the user enters `3`?

```
ph = input("pH: ")
if ph < 7.0:
    print("acid")
```

a) It prints `acid`

b) It prints nothing

c) It raises a `ValueError`

d) It raises a `TypeError`, because a string can't be compared with a float **[correct]**

4.

Assume `prices = {"oil change": 35, "tire rotation": 19, "car wash": 7}`. Write a code segment that reads a service name from the user. If the service is in `prices`, print its cost (e.g. `car wash costs $7`); otherwise print an error such as `error: teleportation is not recognized`, using whatever the user typed.

Sample solution:

```
service = input("Service: ")
if service in prices:
    print(service, "costs $" + str(prices[service]))
else:
    print("error:", service, "is not recognized")
```
